1 Introduction

This report presents magnetic measurements carried out at the Nurmijärvi (NUR) Geophysical Observatory between January 1 and December 31, 2011. The observatory is operated by the Finnish Meteorological Institute (FMI) and is part of the Observation Services Division of the institute. Information about the IMAGE magnetometer network is included in this report, as it is partly operated by the observatory. The Nurmijärvi Geophysical Observatory started recording the Earth's magnetic field in April 1952. The first yearbook was for 1953.

2 Description of the observatory

The observatory is located some 40 km NNW from Helsinki in the northern part of the Nurmijärvi municipality having over 40,000 inhabitants. The observatory lies on a moraine ridge by the lake Sääksjärvi. The 7 ha forest area of the observatory is limited to the lake in the North and North-East, to a nature reserve forest in the South and to a private forest in the West. There are no artificial disturbance sources nearby.

The coordinates of the observatory are:

	Lat.	Lon.
Geographical	60°30.5'N	24°39.3'E
Geomagnetic	57°43.8'	113°28.8'
Corr.geomagnetic	56°49.2'	102°31.2'

The magnetic coordinates are referred to the IGRF-95 model:

L-value	3.3
Height	105m

The Nurmijärvi observatory is running two magnetometers, which are controlled usually once per week with absolute measurements. Another magnetic recording system at the observatory is the three-component pulsation magnetometer of the Sodankylä Geophysical Observatory. The Air Quality Department of FMI makes continuous airborne radioactivity recording. An automatic weather station observes the following: temperature, humidity, snow depth, current weather, rain and clouds. University of Leicester operates the radio transmitter for ionospheric research. The receiver is in United Kingdom. Nurmijärvi municipality needs the water level observations in the lake Sääksjärvi. The seismic station of the Helsinki University has ceased its operation at the observatory and only some temporary measurements are performed.

The Nurmijärvi observatory has a magnetic calibration and test laboratory for magnetometer and sight compass calibrations and for compass swing base measurements at airfields. FINAS (Finnish Accreditation Services) accredited the laboratory as the number K050 on 17th of August 2007. The accreditation was renewed in 2011.

3 Recording instruments

In the variation house the Danish suspended flux gate magnetometer (FGE-89) is the primary instrument. The Ukrainian LEMI-004 flux gate magnetometer is the second variometer. The sensors are directed in geographic North and East directions

measuring the X, Y and Z components. The temperature in the variometer room is kept at 18°C . Analog voltages from the magnetometers are AD-converted in the variation room and the digital data are transferred through optical wires to the computers in the main observatory building. The Linux based software stores the data in three files as one-second, ten-seconds and one-minute averages. Timing is based on GPS time sheared through the local network. The standard one-minute values are averages over one minute periods starting and ending at a half minute (e.g. 59:30 - 00:30, 00:30 - 01:30, 01:30 - 02:30). The given time is the starting minute at the centre of the period (00, 01, 02 etc.).

4 Absolute measurements

The total field (F) was measured by a Polish PMP-7 proton precession magnetometer and declination and inclination with a DI-flux-magnetometer, which consists of a non-magnetic Zeiss-Jena theodolite (010B) and of a flux-gate element mounted on its telescope. The absolute measurements were done on average once a week. The base line values as determined for the FGE are shown in Fig. 3.

5 Data processing and dissemination

In the processing the final base line values and sensitivities were used and hourly mean values were calculated. The measured base line values were followed closer than half a nanoTesla. All the digital data were visually inspected on the computer screen.

Tables showing the three-hour K-indices were computed from 10 s data using the 'FMI' algorithm. The upper limit for K=9 is $750nT$.

Daily magnetograms and K-indices were published in the monthly bulletin together with the Sodankylä Geophysical Observatory of the University of Oulu. The bulletin contains daily magnetograms of Nurmijärvi, Hankasalmi, Oulujärvi and Sodankylä, daily ionosond and riometer recordings and cosmic ray data.

Daily files of minute data were sent by e-mail for the INTERMAGNET system. INTERMAGNET will publish on DVD the minute data, annual means, K-values and base line values from Nurmijärvi together with over a hundred of other magnetic observatories.

6 Secular results of IMAGE stations

The IMAGE magnetometer network (Fig. 4) consisted at the end of 2011 of 32 stations from Tartu in Estonia to Ny Ålesund on Svalbard. The principal investigator of this international project was Eija Tanskanen at FMI. FMI operated nine IMAGE stations in Finland (including Nurmijärvi), one in Estonia and one in northern Norway. At seven of the stations the service and absolute measurements were done in co-operation with the Sodankylä Geophysical Observatory of the Oulu University.

The data sampling intervals at the IMAGE stations were 1, 10 and 60 seconds. The IMAGE standard used the 10s values and they were averages over the seconds 00-10, 10-20, 20-30 etc. The time stamp given for the 10-second period was the first second of that period.

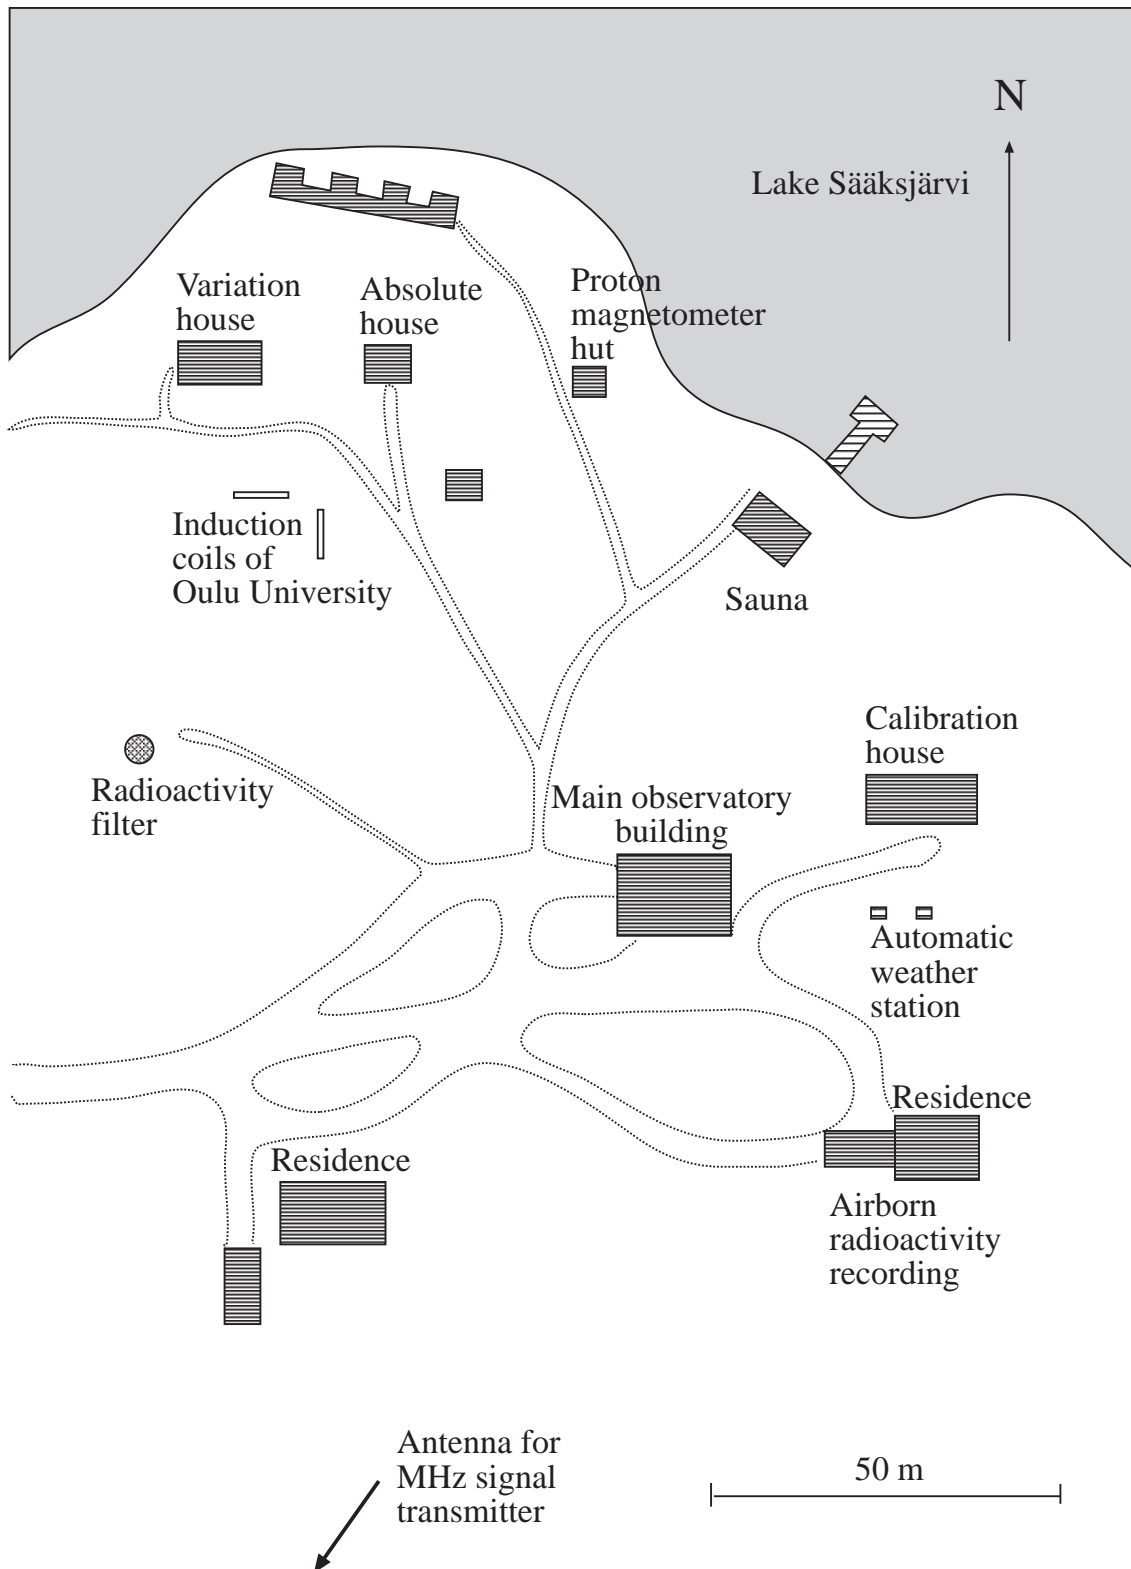

Figure 1: Map of the observatory area.

Year	X[nT]	Y[nT]	Z[nT]	
2002,5	11255	1600	51313	
2004,5	11237	1663	51392	
2005,5	11228	1690	51429	
2006,5	11229	1716	51459	
2007,5	11225	1747	51496	
2008,5	11217	1783	51529	
2009,5	11210	1820	51560	
2010,5	11197	1860	51596	
New-old	46	-76	78	New absolute point
2011,5	11225	1825	51713	

Table 1: Annual mean values (all days) at the Pello IMAGE station.

Most of the stations had ADSL or direct network connections and only OUI was still operated through a GPRS modem. Data transmission from the stations was moved from the observatory to the Helsinki office of FMI. The data of the eleven stations were processed and inspected and were sent for IMAGE filing.

6.1 Pello IMAGE station

Pello (PEL) ($66^{\circ}54.2'N$, $24^{\circ}04.7'E$) close to the border with Sweden in Lapland has a tilt suspended FGE magnetometer and absolute measurements are made once or twice a year. In 2010 a concrete basement at a new point was made for absolute measurements. The annual mean values for all days were calculated and are listed in table 1. The X-component of 2010.5 was erroneous in the 2010 yearbook and is corrected here.

6.2 Oulujärvi IMAGE station

At Oulujärvi (OUJ) ($64^{\circ}31'N$, $27^{\circ}14'E$) absolute measurements were made in 2011 in June and in August. Annual mean values are available since 1993. In the table 2 are the annual mean values for the last 10 years, calculated for the old absolute house until 2006 and for the new absolute house since 2007. The magnetometer is an ordinary Danish FGE in a temperature controlled hut. Oulujärvi is a station of the Oulu University.

6.3 Mekrijärvi IMAGE station

Mekrijärvi (MEK) ($62^{\circ}46'N$, $30^{\circ}58'E$) is located in the easternmost corner of Finland. Usually the absolute measurement is done once in every summer, but in 2011 no measurements were made. The magnetometer, Ukrainian LEMI-004, is installed in a small hut in the woods.

6.4 Hankasalmi IMAGE station

The magnetometer at the Hankasalmi (HAN) ($62^{\circ}15.2'N$, $26^{\circ}35.8'E$) station is the ordinary FGE. A concrete basement for absolute measurements was made nearby the recording magnetometer and absolute measurement have been made every Summer since 2005. The table 4 shows the annual mean values for all days at Hankasalmi.

Figure 3: The magnetometer hut and the concrete basement for absolute measurements at the Tartu station.

6.5 Tartu IMAGE station

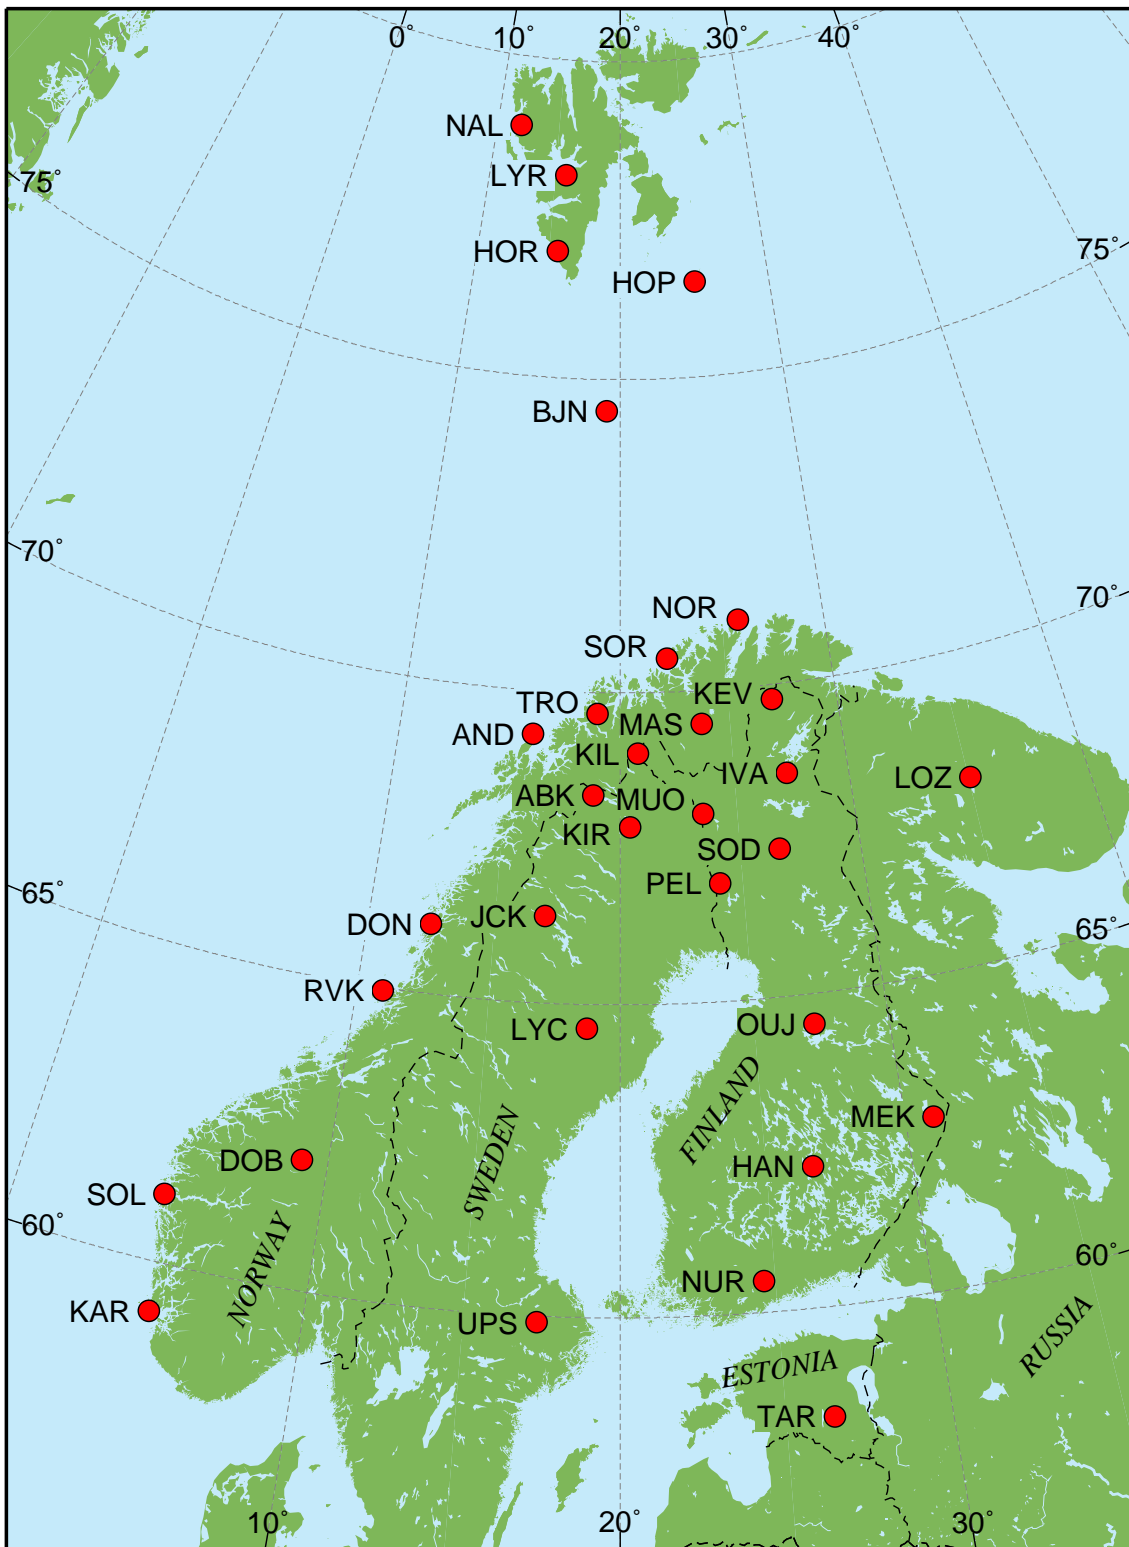

Tartu (TAR) IMAGE station ($58^{\circ}15.8'N$, $26^{\circ}27.6'E$) is located in the area of Tõravere observatory of the Tartu University. The observatory has meteorological and astronomical observation systems. The IMAGE station is visited to make service and absolute measurements usually in the summer season, but not in the years 2009 and 2010. A tilt suspended FGE is the magnetometer at Tartu.

Year	X[nT]	Y[nT]	Z[nT]
2002,5	15714	1981	48694
2004,5	15707	2040	48778

Figure 5: Baseline measurements

9 Tables of Hourly Means of X, Y, and Z

Explanations of the tables:

- **X** is the North component of the magnetic vector
- **Y** is the East component of the magnetic vector
- **Z** is the vertical component of the magnetic vector
- The unit is nanotesla (nT) = 10^{-9} T
- The time is universal time (UTC). The local time is UTC + 2 h (during the daylight saving time UTC + 3 h)

Nurmijarvi Finland

Nurnijarvi Finland

April 2011 North component X in nT (X = 14900 nT + tabular values)

Table with 26 columns (Day, Char, 1-24, Mean) and 31 rows. Rows 1-20 show data for various characters (D, Q) and days. Rows 21-30 show data for characters Q, Q, Q, D. Rows 31-32 show 'All Quiet' and 'Dist.' summary rows.

April 2011 East component Y in nT (Y = 1400 nT + tabular values)

Table with 26 columns (Day, Char, 1-24, Mean) and 31 rows. Rows 1-20 show data for characters D, Q, D, Q, D, Q, D. Rows 21-30 show data for characters Q, Q, Q, D. Rows 31-32 show 'All Quiet' and 'Dist.' summary rows.

April 2011 Vertical component Z in nT (Z = 49400 nT + tabular values)

Table with 26 columns (Day, Char, 1-24, Mean) and 31 rows. Rows 1-20 show data for character D. Rows 21-30 show data for characters D, Q, Q, Q, D. Rows 31-32 show 'All Quiet' and 'Dist.' summary rows.

Nurmijarvi Finland

September 2011 North component X in nT (X = 14900 nT + tabular values)

Table with 26 columns (Day, Char, 1-24, Mean) and 30 rows of data for September 2011 North component X in nT.

September 2011 East component Y in nT (Y = 1400 nT + tabular values)

Table with 26 columns (Day, Char, 1-24, Mean) and 30 rows of data for September 2011 East component Y in nT.

September 2011 Vertical component Z in nT (Z = 49400 nT + tabular values)

Table with 26 columns (Day, Char, 1-24, Mean) and 30 rows of data for September 2011 Vertical component Z in nT.

Nurmijarvi Finland

November 2011 North component X in nT (X = 14900 nT + tabular values)

Table with 26 columns (Day, Char, 1-24, Mean) and 30 rows of data for the North component X in nT. Includes 'All Quiet Dist.' summary rows at the bottom.

November 2011 East component Y in nT (Y = 1400 nT + tabular values)

Table with 26 columns (Day, Char, 1-24, Mean) and 30 rows of data for the East component Y in nT. Includes 'All Quiet Dist.' summary rows at the bottom.

November 2011 Vertical component Z in nT (Z = 49400 nT + tabular values)

Table with 26 columns (Day, Char, 1-24, Mean) and 30 rows of data for the Vertical component Z in nT. Includes 'All Quiet Dist.' summary rows at the bottom.

Nurmijarvi Finland

December 2011 North component X in nT (X = 14900 nT + tabular values)

Table with 25 columns (Day, Char, 1-24, Mean) and 31 rows of data for North component X.

December 2011 East component Y in nT (Y = 1400 nT + tabular values)

Table with 25 columns (Day, Char, 1-24, Mean) and 31 rows of data for East component Y.

December 2011 Vertical component Z in nT (Z = 49400 nT + tabular values)

Table with 25 columns (Day, Char, 1-24, Mean) and 31 rows of data for Vertical component Z.

17 Earth's Magnetic Field Maps of Finland 2012.0

The isolines of total field (F) and horizontal field (H) are given in nanoteslas (nT), declination (D, positive eastwards) and inclination (I, positive downwards) in degrees of arc.

TOTAL INTENSITY (F) 2012.0

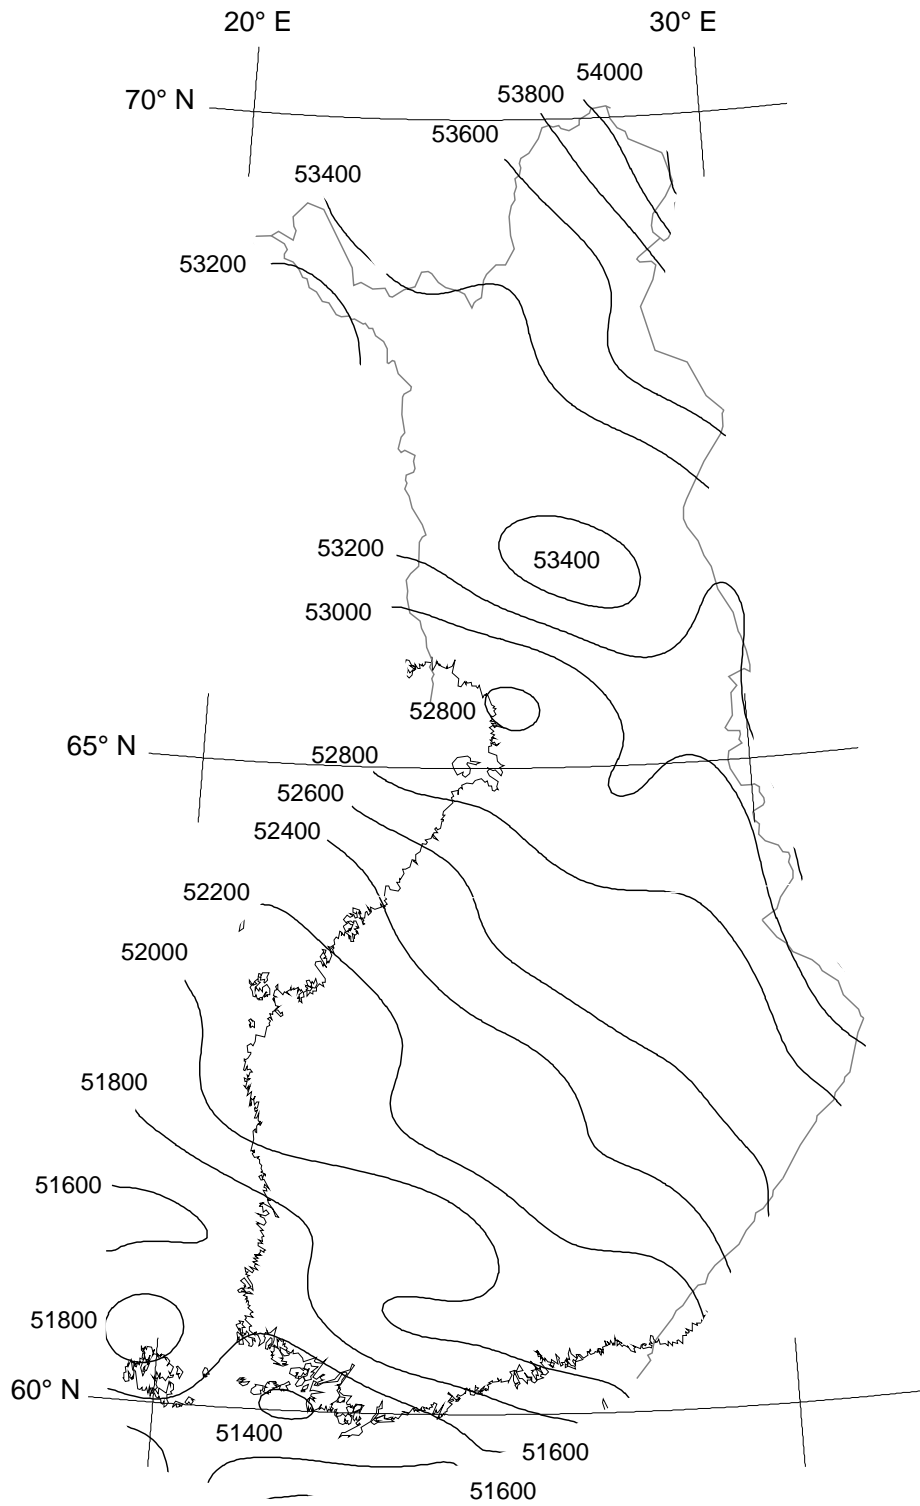

Figure 16: Total intensity F 2012.0 in nT

HORIZONTAL INTENSITY (H) 2012.0

Figure 17: Horizontal intensity H 2012.0 in nT

DECLINATION (D) 2012.0

Figure 18: Declination D 2012.0 in degrees

INCLINATION (I) 2012.0

Figure 19: Inclination I 2012.0 in degrees
